

REASONS IT MAY BE TIME TO REPLACE

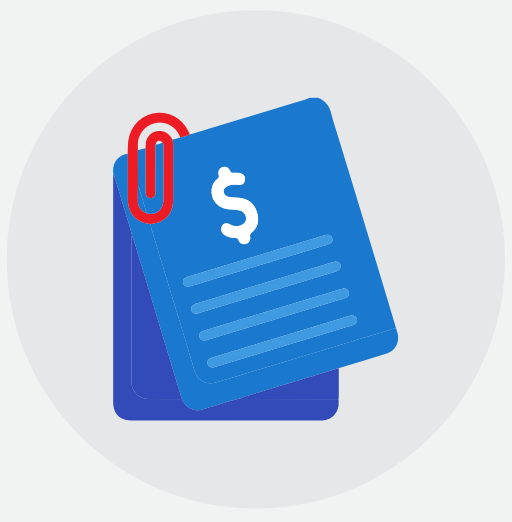

YOUR HVAC SYSTEM

There are several good reasons to replace your home's HVAC system before it breaks down completely.

Your system is more than 10 years old

Residential heating and air conditioning systems only have a lifespan of about 10-15 years, and they start losing efficiency over time.

Higher utility bills than before

If you're paying more for the same usage each year, then your unit isn't operating as efficiently as it should be.

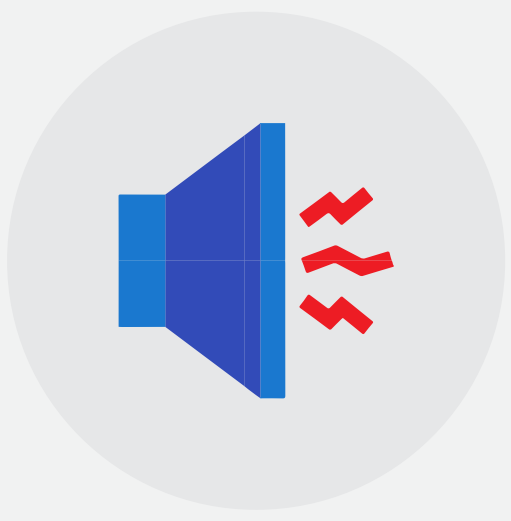

You're calling for repairs more often

The parts of your HVAC system will wear out over time, and this happens more often as the unit gets older.

Short cycling

Short cycling is the term for turning on and off frequently, which could indicate a problem with the pilot light or ignition.

Loud banging or rattling noises

The furnace or air conditioner should hum quietly in the background. Banging or other loud noises may indicate a loose or broken part.

Poor indoor air quality

Stale, musty air can indicate a build-up of dust and debris in the furnace, which is circulating throughout your house and polluting the air.

Spotty heating or cooling

Unless you've zoned your home on purpose, it should feel the same temperature throughout. Uneven heating and cooling is a sign of an inefficient furnace or air conditioner.

If one or more of these is happening with your furnace or air conditioner, call Infinity Texas Air today at
